

Snitch Enterprise Auditor

Advanced Content Detection For Enterprise Networks

Control inappropriate material in the workplace with Snitch Enterprise Auditor. Featuring automated remote workstation scans and advanced file analysis, Snitch Enterprise Auditor makes cleaning your network simple.

Snitch Enterprise Auditor is a network scanning and analysis product designed specifically to detect inappropriate material on enterprise systems.

Combining best-of-breed technologies including a third-generation file analysis engine, over-the-network scanning with queueing and scheduling, and powerful reporting functions, Snitch Enterprise Auditor provides the tools you need to locate and remove inappropriate files, and to address the problem at its source.

By allowing remote scanning of networked workstations and servers, Snitch Enterprise Auditor helps organizations address the problem of pornography and inappropriate files in the workplace.

SkinScan™ algorithm detects adult images and video by assessment of skin-tone levels and distribution, and other key indicators. This method can be used to quickly locate media files containing nudity and obscenity, on workstations and server storage.

Network Scanning allows scanning of network resources such as workstations and servers from a remote networked testing system. The scanning engine is designed to withstand unscheduled shutdowns during extended scans without loss of data.

Queued and Scheduled Scans permit groups of systems to be predefined and batch scanned as required. Scheduling allows scans to be automatically performed outside normal work hours to minimize impact on bandwidth.

Keyword Analysis allows detection of key-words and phrases within files. The keyword engine compares filenames, document content and URL's against a comprehensive list of predefined / custom keywords, to further identify obscene files. New keyword matching capabilities give the ability to include and exclude keyword / phrases based on their context and surrounding text.

Scan Results Reporting - generate HTML or Word document reports for your search results. Reports can include thumbnails of Movies and Images, exported files, show keyword matching, dates, sizes, paths and much more.

Safe File and Folder Exclusion minimizes scan time and bandwidth impact by allowing exclusion of known safe files. Create safe file lists that can be applied to all scanned systems.

Unicode Support permits scanning for keywords and phrases in any language or character set.

Many File Types Supported - Images and video files, audio, document, internet cache, compressed files, and custom file types are also supported.

Features:

- SkinScan Technology
- Image Analysis
- Video Analysis
- Document Analysis
- Audio File Analysis
- Internet Cache Analysis
- Compressed File Interrogation
- File Signature Checking
- Interactive Report Generation
- Custom Keyword Capability
- Safe File List
- Auto Deletion Capability
- Custom File Search
- Scan Queuing
- Scan Scheduling
- Save/load results to file
- Unicode Compliant.

Benefits:

- Reduces Legal Liability
- Increases Productivity
- Identifies AUP Risk
- Saves Time
- Easy To Use
